

# CS410 Project Progress Report

Topic: Chrome extension for Google Scholar

Date:11/14/2011

## Progress made

1. Following the Chrome extension developing tutorial, I've designed the user interface for the Chrome extension and made the .css, .html, and .js and manifest.json files.
2. I've implemented the function to count the independence citation numbers for each publication listed in the Google Scholar author page, in the .js file.

## Remaining tasks

1. From the articles that cite a publication, find the most relevant articles to the publication, make it a recommended reading list to the scholar.
2. Make a list of the authors who cited your publications, with their Google Scholar links.

## Challenges faced

1. Learn the steps for making a Chrome extension and make it work on my local machine.
2. Study the Google Scholar page to find the best key word to crawl for the citation counting purpose.
